Contents

* Speedy settings with free DAQ Software

* <u>Reading data from a CO₂ sensor</u>

Speedy settings with free DAQ Software

We are pleased to offer all Monitor subscribers a free copy of ComDebug. With it you can:

- 1. Trouble-shoot TCP/IP anc COM communication problems
- 2. Log data from devices connected over Modbus, TCP/IP, and, via USB adapators or otherwise, RS232, RS422 and RS485

You need to tell ComDebug about your instrument, making choices from menus and dialogue boxes. When you click Save, ComDebug saves your settings in an *.imd file.

Some advanced users, when they want to make a small change to their settings, like to edit the imd file directly.

Here we tell you exactly what the entries in the imd file mean.

You will find your imd file in the Windmill directory. You can edit it in any text editing program, like Notepad or Wordpad.

IMPORTANT: Before editing your imd file please make a backup

Communications

The first part of the file stores details about your communications. For example:

```
[COMMUNICATIONS]
Port=24
Baud=115200
Bits=8
Parity=0
Stopbits=1
Handshake=0
IPAddress=
IPport=0
IPName=
```

These are the details you entered in the TCP/IP or COM Port Settings. They must be the same as your instrument is using.

COM Port Settings	
Comms Settings	
8	

Data Bits		
Parity	None	
Comm Port	COM24	
Baud Rate	115200	
Stop Bits	1	
Flow Control	None	
ОК	Help TCP/IP Cancel	

Port	- the number of the COM port to which your
	device is connected
Baud	- the baud rate of the instrument
Bits	- the group of Data Bits used, 7 or 8
Parity	- O represents no parity,
	1 odd parity,
	2 even parity,
	3 mark parity and
	4 space parity
Stopbits	- 1 or 2
Handshake	- 0 represents no handshaking or flow control,
	1 Xon/Xoff or software handshaking,
	2 hardware handshaking.
IPAddress	- when your instrument has a fixed
	IP address. It will be in the format
	89 29 204 24
TPnort	- the Port Number within the TP address
rport	che fort Number within the if address.
IPName	- when your instrument has a dynamic
	IP address.

You can learn more sabout TCP/IP settings at the <u>Understanding TCP/IP</u> page and about com port settings at <u>Collecting Data through the COM Port</u>.

Message

The Message part of the file tells ComDebug how to grab the data from the string of characters sent by the instrument:

```
[Message1]
Name=Message_1
Prompt=W\C(013)\C(010)
Parse=\I"0123456789"\E(0)"\C(013)"
Ack=
```

\C indicates a non-printing character. These are detailed at <u>https://www.windmill.co.uk/ascii-control-codes.html</u>. \C(013) for example, specifies a carriage return, and \C(1010) a line feed.

🖱 Message Edit - Message_1									
<u>E</u> dit <u>N</u> onPrint <u>O</u> utputs <u>W</u> ait C <u>R</u> C <u>H</u> elp									
	Promp	t		Reply		Ackn	owledge	ment

1	W	77		002	02				Status
2	013	OD		1	31				
3	010	0A		7	37				COM
				4	34				LUM
					2E				

		2 32 013 0D	-		Parse				
E Win	dmill Reply Parser								
Edit Steps NonPrint Add Action Extract Step Help									
_	A. 10	Parametero	Chan	Name	Value				
Step	Action	Li giginerere	Onland						
Step 1	Action	0123456789	Chan						
Step 1 2	Ignore Until Extract Until	0123456789 \C(013)	0	weight	174.32				

Using ComDebug to enter the Prompt and Parse string

Prompt	-	The command sent to the instrument to ask for data. In the example above it is W followed by a carriage return $- C(013)$ - and a line feed - $C(010)$.
Parse	_	ComDebug extracts the actual data from the superfluous characters around it. In our example above \I tells ComDebug to ignore everything until it reaches a numerical digit. \E tells ComDebug to extract characters until a carriage return - \C(013) - occurs. It stores the data in channel 0.
Ack	-	Some instruments need an acknowledgement that they have sent data, which will be given

in the Ack line.

Other options are available, for example:

\I followed by a number not in quotes, means ignore the next n bytes Similarly, \E followed by a number means extract the next n bytes \S means search for all these characters, for example \S"data="

ComDebug can extract data in lots of ways - *Extract Until* or *Extract the Next N* are the most common but there are many other options including:

\H	-	Extract N Bytes as Hex
∖J	-	Extract Integer LSB-MSB (16-bit 2s complement integer:
		2 bytes, -32768 to +32767)
\K	-	Extract Integer MSB-LSB (16-bit 2s complement integer:
		2 bytes, -32768 to +32767)
\L	-	Extract Word LSB-MSB (16-bit 2s complement integer:
		2 bytes, 0 to 65535)
NΛ	-	Extract Word MSB-LSB (16-bit 2s complement integer:
		2 bytes, 0 to 65535)
N	-	Extract Signed Byte (A single byte of data interpreted
		as a value in the range -128 to +127)
\0	-	Extract Byte (A single byte of data interpreted as
		a value in the range 0 to 255)
\Ρ	-	Extract Bit (A single bit of data, which can only
		have values of 1 or 0)
\Q	-	Extract Float (Four byte floating point)
\R	-	Extract Reverse Float (As Float, but the bytes are
		in reverse order)
\T	-	Record Number (enables Windmill to know that a new
		reading has been taken, even if that reading is the
		same as the previous one)

If you need help setting up ComDebug to work with your instrument - we have a series of examples at <u>https://www.windmill.co.uk/serial_driver.html</u>. There is also help on parsing messages at <u>https://www.windmill.co.uk/parse.html</u>

Your DAQ questions answered - Upgrading Mettler Toledo system

Question

"A Question with the configuration of ComDebug with a CO₂ sensor. The modbus communication is as follows: sensor address 2, data vector 101, length 1 word. Would you be so kind to provide me the values to enter in the message to the sensor, specifically I do not understand how to enter the most significant and least significant bit data, thank you very much in advance.

Thanks "

Answer

Assuming the 101 is in decimal, and you are using binary communications, you need to convert it to hexadecimal, ie 0065, with 00 being most significant byte and 65 being least significant. So something like the below to read the holding register.

	Con	Debug	Term	ninal	Sc	reen	6
E	Edit <u>N</u>	onPrint	<u>0</u>	utput	s	Wa	it
		Prompt	:				
	Byte	Char	Hex	•		Г	Byt
	1	002	02				í
	2	003	03				-
	3	000	00				
	4	е	65				
						-	

More details on using ComDebug with Modbus instruments is at <u>https://www.windmill.co.uk/modbussettings.html</u>
